

Sustainable Energy - without the hot air

David MacKay

Department of Physics
University of Cambridge

www.withouthotair.com

Summary: **We need a plan that adds up**

● We need to get off fossil fuels

- Numbers, not adjectives
- Not easy; but possible

● All renewables are diffuse

- to make a difference, renewable facilities have to be country-sized

● The supply options are:

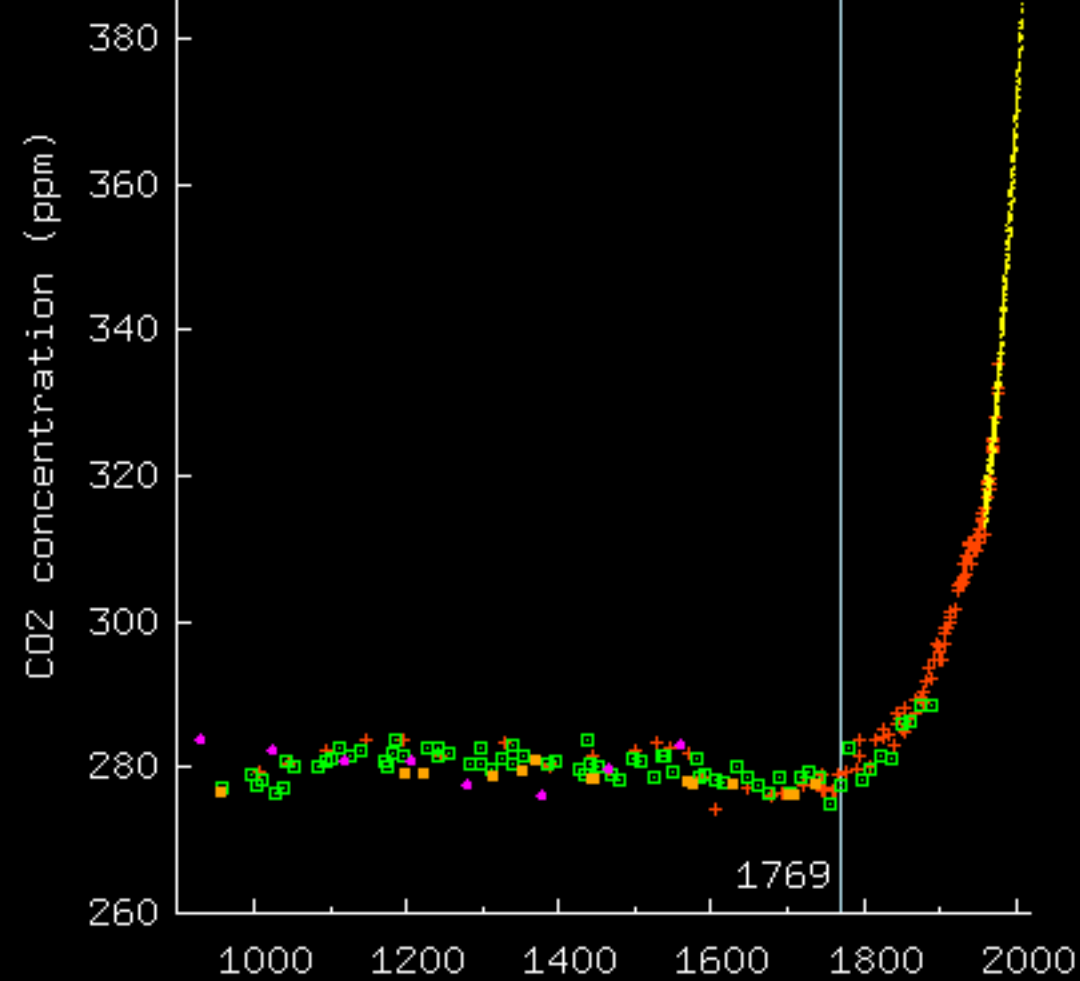

- our renewables
- other countries' renewables
- nuclear

We need to get off fossil fuels

- 1: fossil fuels will run out
 - + maybe future generations would prefer to do something smarter with them
- 2: climate change
- 3: security of supply

Sources: Keeling and Whorf (2005); Neftel et al (1994); Etheridge et al (1998); Siegenthaler et al (2005); Indermuhle et al (1999)

Giant Wind Farm Off English Coast Pits Town Against Shell, E.ON

Graveney was the site of the last combat on English soil when British forces battled a downed German bomber crew in 1940. Now the village is fighting a new enemy: the world's biggest wind farm. The local council, acting on behalf of the town's 473 residents, refused to permit a substation for the \$1.5 billion London Array, which would put 271 wind turbines in the estuary of the River Thames. Royal Dutch Shell Plc and E.ON AG plan to bring power cables ashore near Graveney. "They say this is the only place they could put it — that's rubbish," said retiree George Schneider, 73, strolling on Saxon Shore Way, a rambling route across the coastal plain. "Why use a green-field site when there are other places?"

Wind farm 'a threat to our airport'

Southend Airport has raised serious objections to plans to build a new wind farm - even though the turbines would be nearly 15 miles to the north. Experts say a wind farm next to the defunct nuclear power station, at Brightlingsea, could cause air traffic control issues and might even interfere with radar. Airport manager Alistair Welch raised the concerns at a public inquiry which is being held in the town.

June 22, 2007 in Echo

Southend Airport has raised serious objections to plans to build a new wind farm - even though the turbines would be nearly 15 miles to the north.

Job creation

In Porthcawl in south Wales, a pressure group called SOS Porthcawl has been set up to oppose plans for a wind farm four miles out to sea.

The proposal is for 30 turbines on Scarweather Sands, each 453 feet high.

It could provide enough energy for more than 40,000 homes.

The production of the turbines could also create 130 jobs - they are made in Wales at Bangor and more could be produced at Port Talbot.

Tourism

But SOS Porthcawl says the turbines will be noisy and visible from beauty spots, which would deter tourists.

Protesters target wind farm plans

Plans of how the wind farm will look are on display

Porthcawl is a popular spot for surfers

Local people opposing plans to build one of the UK's biggest offshore wind farms on the south Wales coast met on Friday. Residents in Porthcawl gathered to highlight their opposition to the proposed 30-turbine Porthcawl Sands.

SOS Porthcawl was set up by campaigners in the town who say the wind farm will adversely affect the holiday resort which attracts surfers and tourists from all over the UK. The demonstration coincides with a public consultation into the project by developers United Utilities Green Energy. Four-times British surf champion, Simon Tucker said there was a lot of feeling against the proposals within the town. "This demonstration is to ask the developers not to destroy the very environment they claim they are trying to protect," he said. Mr Tucker said the turbines, which are taller than the Statue of Liberty in New York, will destroy the panoramic views and also have an impact on the sea.

"The turbines will change the shape of the sandbanks and the waves," he said. "If the waves are changed and people stop sport because of the turbines then the town is going to be left behind. The company behind the £100m scheme say the turbines, which will be built at sea level, will generate enough power for 86,000 homes. The site, which is to the west of Porthcawl, is approximately 10 miles from the nearest household.

Project - Is This A New Klondyke?

The *Wrexham Herald* (linked above) talks about the views and disappearing as we used to know them - vast stretches of coastline as they had been for hundreds of years and a new industrial scene. As we watch the first massive turbines on the Caithness and Sutherland coast are we watching the loss of another aspect of our scenery - the coastal views? Is this another hazard for fishing boats and vessels to be lost to view now of anyone on the east of Caithness are there others as we face up to rising oil prices and the impact of wind turbines? We already see oil rigs with in view. Will wind turbines be out at sea then on our hills and mountains?

Fishermen oppose wind farm plans

Hundreds of fishermen gathered in the Wash to protest against plans to build offshore wind turbines.

The men from Boston, Skegness and King's Lynn are unhappy at government proposals to erect 250 wind turbines in the Greater Wash.

If it goes ahead, the facility would be part of one of the largest wind farms in the world.

Planning permission has already been granted for 60 turbines on two sites off the south Lincolnshire coast.

Project 'impractical'

Andy Roper, who organised the protest, emphasised the fishermen's livelihoods are being threatened.

Hundreds of turbines could be built about five miles off the coast

Winds of change will mean giant sea turbines

By [Anthony Browne](#), Environment Editor

DOZENS of wind farms, each with hundreds of turbines up to 500ft high, are to be given the go-ahead off the coast between Scotland and Wales, around the Wash in East Anglia and in the Thames Estuary.

Yesterday's announcement was welcomed by some environmental groups; others have given warning that it will ruin views and damage sea life. Fishermen have said that they will be forced out of business.

Brian Wilson, the Energy Minister, said: "In theory, these areas could source enough electricity to power the whole of Britain, albeit intermittently. There is no doubt

Wind power 'a security risk'

02 November 2007 **08:15**

Defence chiefs threw the future of East Anglia's wind energy industry into confusion last night after claiming that wind turbines could be a threat to national security.

Experts say the MoD now objects to about 50pc of applications to build onshore wind turbines because of concerns they affect performance of military radar.

Wind farms 'a threat to national security'

[Magnus Linklater](#) and [Dominic Kennedy](#)

Ambitious plans to meet up to a third of Britain's energy needs from offshore wind farms are in jeopardy because the Ministry of Defence objects that the turbines interfere with its radar.

The MoD has lodged last-minute objections to at least four onshore wind farms in the line of sight of its stations on the east coast because they make it impossible to spot aircraft, *The Times* has learnt. The same objections are likely to apply to wind turbines in the North Sea, part of the massive renewable energy project announced by John Hutton, the Energy Secretary, barely two months ago. They would be directly in line with the three principal radar defence stations, Brizlee Wood, Saxton Wold and Trimmingham on the Northumberland, Yorkshire and Norfolk coasts.

- Not easy; but possible

● All renewables are diffuse

- to make a difference, renewable facilities have to be country-sized

● The supply options are:

- our renewables
- other countries' renewables
- nuclear

Efficiency

● Jevons' paradox

"as technological improvements increase the efficiency with which a resource is used, total consumption of that resource may increase, rather than decrease."

For example, from 1900 to 2000, passenger transportation in the USA became 5 times more energy-efficient;
but nowadays, the average person travels 50 times further.

Efficiency II

● Heating

$$\text{Heat loss (kWh/d)} = \text{Leakiness (kWh/d/°C)} \times \text{Average temperature difference (°C)}$$

Turn the thermostat down

$$\text{Heat loss (kWh/d)} = \text{Leakiness (kWh/d/}^{\circ}\text{C)} \times \text{Average temperature difference (}^{\circ}\text{C)}$$

Average temperature difference

Reduce leakiness

New leakiness: $6 \text{ kWh/d/}^{\circ}\text{C}$

Huge expansion for wind turbines

There could be more than two offshore wind turbines per mile of UK coastline under plans being set out by ministers.

The aim is for 20% of EU energy to come from renewables by 2020

Business Secretary John Hutton says he wants to open up British seas to allow enough new turbines - up to 7,000 - to power all UK homes by the year 2020.

John Sauven, the executive director of Greenpeace, said that the plans amounted to a "wind energy revolution".
"And Labour needs to drop its obsession with nuclear power, which could only ever reduce emissions by about 4% at some time in the distant future."

How does nuclear's pathetic 4% compare with the proposed offshore wind?

'33GW' of offshore wind would deliver on average 10GW, which is 4kWh/d per person

4%!

Summary

- People say things that don't add up
 - Planes, Volvos, Green tariff, Offsetting
 - Nuclear versus wind
- We need numbers not adjectives
- Renewables are diffuse
 - To make a difference, renewable power facilities need to be country-sized
 - Britain can't live on its own renewables
- How to get off fossil fuels
 - Electrify all transport
 - Electrify all building-heating using heat pumps
 - Renewables
 - Nuclear power
 - (Clean coal)
 - Solar power in someone else's desert

Carbon translation chart

Power translation chart

1 kWh/d	the same as 1/24 kW	'UK'	= 60 million people
GW	often used for ' capacity ' (peak output)	USA:	300 kWh/d each
TWh/y	often used for average output	Europe:	120 kWh/d each
1 Mtoe	'one million tonnes of oil equivalent'		

Nuclear power 'completely infeasible'?

"For nuclear power to make a significant contribution to a reduction in global carbon emissions in the next two generations, the industry would have to construct nearly 3000 new reactors [over 60 years] ...

[This is] a pipe dream and completely infeasible. **The highest historic rate of build is 3.4 new reactors a year."**

(Guardian, citing an Oxford Research Group report, 4th July 2007)

The truth
